

IN THE SPECIFICATION:

Please replace paragraph 3 at page 1, with the following paragraph:

AI --Microperforations weaken a substrate and are generally acceptable for providing a line of separation in a substrate. The conventional use of microperforations weakens substrates too much to provide fold lines. The weakened substrate will typically partially separate or fall apart when additionally weakened by folding or will separate upon use after folding. U.S. Patent 6,136,130 states at col. 2, lines 27-35 that: "These microperforations formed a weakened line across a sheet which was greatly weakened by a fold along the perforations, so that the sheets required less than 1 or 2 kilograms of force for separation and these weakened sheets did not print reliably following folding and unfolding".--
